In poker, the probability of each type of 5-card

hand can be computed by calculating the proportion of hands of that type among all possible hands.

History [edit]

Probability and gambling have been ideas since long before the invention of poker. The development of probability theory in the late 1400s was attributed to gambling; when playing a game with high stakes, players wanted to know what the chance of winning would be. In 1494, Fra Luca Paccioli released his work Summa de arithmeticā, geometriā, proportioni et proportionalitā which was the first written text on probability. Motivated by Paccioli's work, Girolamo Cardano (1501-1576) made further developments in probability theory. His work from 1550, titled Liber de Ludo Aleae, discussed the concepts of probability and how they were directly related to gambling. However, his work did not receive any immediate recognition since it was not published until after his death. Blaise Pascal (1623-1662) also contributed to probability theory. His friend, Chevalier de Méré, was an avid gambler with the goal to become wealthy from it. De Méré tried a new mathematical approach to a gambling game but did not get the desired results. Determined to know why his strategy was unsuccessful, he consulted with Pascal. Pascal's work on this problem began an important correspondence between him and fellow mathematician Pierre de Fermat (1601-1665). Communicating through letters, the two continued to exchange their ideas and thoughts. These interactions led to the conception of basic probability theory. To this day, many gamblers still rely on the basic concepts of probability theory in order to make informed decisions while gambling.[1][2]

Frequencies [edit]

5-card poker

hands [edit]

An Euler diagram depicting poker hands and their odds from a typical American 9/6 Jacks or Better machine

In straight poker and five-card draw, where there are no hole cards, players are simply dealt five cards from a deck of 52.

The following

chart enumerates the (absolute) frequency of each hand, given all combinations of five cards randomly drawn from a full deck of 52 without replacement. Wild cards are not considered. In this chart:

Distinct hands is the number of different ways to draw the hand, not counting different suits.

is the number of different ways to draw the hand, not counting different suits. Frequency is the number of ways to draw the hand, including the same card values in different suits.

is the number of ways to draw the hand, the same card values in different suits. The Probability of drawing a given hand is calculated by dividing the number of ways of drawing the hand (Frequency) by the total number of 5-card hands (the sample space; $(52 \times 5) = 2,598,960$) or one in 649,740. One would then expect to draw this hand about once in every 649,740 draws, or nearly 0.000154% of the time.

of drawing a given hand is calculated by dividing the number of ways of drawing the hand () by the total number of 5-card hands (the sample space; , or one in 649,740. One would then expect to draw this hand about once in every 649,740 draws, or nearly 0.000154% of the time. Cumulative probability refers to the probability of drawing a hand as good as or better than the specified one. For example, the probability of drawing three of a kind is approximately 2.11%, while the probability of drawing a hand at least as good as three of a kind is about 2.87%. The cumulative probability is determined by adding one hand's probability with the probabilities of all hands above it.

refers to the

probability of drawing a hand as good as the specified one. For example, the probability of drawing three of a kind is approximately 2.11%, while the probability of drawing a hand as good as three of a kind is about 2.87%. The cumulative probability is determined by adding one hand's probability with the probabilities of all hands above it. The Odds are defined as the ratio of the number of ways not to draw the hand, to the number of ways to draw it. In statistics, this is called odds against . For instance, with a royal flush, there are 4 ways to draw one, and 2,598,956 ways to draw something else, so the odds against drawing a royal flush are 2,598,956 : 4, or 649,739 : 1. The formula for establishing the odds can also be stated as $(1/p) - 1 : 1$, where p is the aforementioned probability.

are defined as the ratio of the number of ways to draw the hand, to the number of ways to draw it. In statistics, this is called . For instance, with a royal flush, there are 4 ways to draw one, and 2,598,956 ways to draw something else, so the odds against drawing a royal flush are 2,598,956 : 4, or 649,739 : 1. The formula for establishing the odds can also be stated as , where is the aforementioned probability. The values given for Probability, Cumulative probability, and Odds are rounded off for simplicity; the Distinct hands and Frequency values are exact.

The nCr function on most scientific calculators can be used to calculate hand frequencies; entering nCr with 52 and 5, for example, yields $(52 \times 5) = 2,598,960$ as above.

The royal flush is a case of the

straight flush. It can be formed 4 ways (one for each suit), giving it a probability of 0.000154% and odds of 649,739 : 1.

When ace-low straights and ace-low straight flushes

are not counted, the probabilities of each are reduced: straights and straight flushes

each become 9/10 as common as they otherwise would be. The 4 missed straight flushes become flushes and the 1,020 missed straights become no pair.

Note that since suits

have no relative value in poker, two hands can be considered identical if one hand can be transformed into the other by swapping suits. For example, the hand 3 7 8 Q A is identical to 3 7 8 Q A because replacing all of the clubs in the first hand with diamonds and all of the spades with hearts produces the second hand. So eliminating identical hands that ignore relative suit values, there are only 134,459 distinct hands.

The number of distinct poker hands is even smaller. For example, 3 7 8 Q A and 3 7 8 Q A are not identical hands when just ignoring suit assignments because one hand has three suits, while the other hand has only two—that difference could affect the relative value of each hand when there are more cards to come.

However, even though the hands are not identical from that perspective, they still form equivalent poker hands because each hand is an A-Q-8-7-3 high card hand. There are 7,462 distinct poker hands.

7-card poker hands [edit]

In some popular variations of

poker such as Texas hold 'em, the most widespread poker variant overall,[3] a player uses the best five-card poker hand out of seven cards.

The frequencies are calculated

in a manner similar to that shown for 5-card hands,[4] except additional complications arise due to the extra two cards in the 7-card poker hand. The total number of distinct 7-card hands is $(52 \choose 7) = 133,784,560$. It is notable that the probability of a no-pair hand is lower than the probability of a one-pair or two-pair hand.

The Ace-high straight flush or royal flush is slightly more frequent (4324) than the lower straight flushes (4140 each) because the remaining two cards can have any value; a King-high straight flush, for example, cannot have the Ace of its suit in the hand (as that would make it ace-high instead).

(The frequencies

given are exact; the probabilities and odds are approximate.)

Since suits have no

relative value in poker, two hands can be considered identical if one hand can be transformed into the other by swapping suits. Eliminating identical hands that ignore relative suit values leaves 6,009,159 distinct 7-card hands.

The number of distinct

5-card poker hands that are possible from 7 cards is 4,824. Perhaps surprisingly, this is fewer than the number of 5-card poker hands from 5 cards, as some 5-card hands are impossible with 7 cards (e.g. 7-high and 8-high).

5-card lowball poker hands [edit]

[

Some variants of poker, called lowball, use a low hand to determine the winning hand.

In most variants of lowball, the ace is counted as the lowest card and straights and flushes don't count against a low hand, so the lowest hand is the five-high hand

A-2-3-4-5, also called a wheel. The probability is calculated based on $(52 \choose 5) = 2,598,960$, the total number of 5-card combinations. (The frequencies given are exact; the probabilities and odds are approximate.)

Hand Distinct hands Frequency Probability Cumulative Odds against 5-high

Hand	Distinct hands	Frequency	Probability	Cumulative	Odds against 5-high
1 1,024	0.0394%	0.0394%	2,537.05 : 1	6-high	5 5,120 0.197%
15,360	0.591%	0.827%	168.20 : 1	8-high	35 35,840 1.38%
2.76%	4.96%	35.26 : 1	10-high	126 129,024 4.96%	
					9.93% 19.14 : 1
					Jack-high 210 215,040

8.27% 18.2% 11.09 : 1 Queen-high 330 337,920 13.0% 31.2% 6.69 : 1 King-high 495 506,880
19.5% 50.7% 4.13 : 1 Total 1,287 1,317,888 50.7% 50.7% 0.97 : 1

As can be seen from the

table, just over half the time a player gets a hand that has no pairs, threes- or fours-of-a-kind. (50.7%)

If aces are not low, simply rotate the hand descriptions so that 6-high replaces 5-high for the best hand and ace-high replaces king-high as the worst hand.

Some players do not ignore straights and flushes when computing the low hand in lowball. In this case, the lowest hand is A-2-3-4-6 with at least two suits.

Probabilities are adjusted in the above table such that "5-high" is not listed", "6-high" has one distinct hand, and "King-high" having 330 distinct hands, respectively. The Total line also needs adjusting.

7-card lowball poker hands [edit

]

In some variants of poker a player uses the best five-card low hand selected from seven cards. In most variants of lowball, the ace is counted as the lowest card and straights and flushes don't count against a low hand, so the lowest hand is the five-high hand A-2-3-4-5, also called a wheel. The probability is calculated based on (52 7) = 133 , 784 , 560 {\textstyle {52 \choose 7}=133,784,560} , the total number of 7-card combinations.

The table does not extend to include five-card hands with at least one pair. Its "Total" represents the 95.4% of the time that a player can select a 5-card low hand without any pair.

Hand Frequency Probability Cumulative Odds against

Hand	Frequency	Probability	Cumulative	Odds against
5-high	781,824	0.584%	0.584%	170.12 : 1
6-high	3,151,360	2.36%	2.94%	41.45 : 1
7-high	7,426,560	5.55%	8.49%	17.01 : 1
8-high	13,171,200	9.85%	18.3%	9.16 : 1
9-high	19,174,400	14.3%	32.7%	5.98 : 1
10-high	23,675,904	17.7%	50.4%	4.65 : 1
Jack-high	24,837,120	18.6%	68.9%	4.39 : 1
Queen-high	21,457,920	16.0%	85.0%	5.23 : 1
King-high	13,939,200	10.4%	95.4%	8.60 : 1
Total	127,615,488	95.4%	95.4%	0.05 : 1

(The frequencies

given are exact; the probabilities and odds are approximate.)

If aces are not low,

simply rotate the hand descriptions so that 6-high replaces 5-high for the best hand and ace-high replaces king-high as the worst hand.

Some players do not ignore straights

and flushes when computing the low hand in lowball. In this case, the lowest hand is A-2-3-4-6 with at least two suits. Probabilities are adjusted in the above table such that "5-high" is not listed, "6-high" has 781,824 distinct hands, and "King-high" has 21,457,920 distinct hands, respectively. The Total line also needs adjusting.

Escolha sempre carangueijo como apostar mr jack bet vez de lagosta, e a maioria dos cozinheiros profissionais faria o mesmo

O caranguejo fresco oferece a melhor de ambos os mundos: carne branca e marrom excepcional. Além disso, é mais versátil, como mostrado neste risoto de hoje. Quanto à pudim de figo, entendo que este fruto é um ingrediente Marmite - se soubermos ser honestos, há um tempo como apostar mr jack bet que eu também não "entendia" figos - mas uma figo madura e macia é maravilhosamente pesada com seu próprio xarope melado e carnuda e granulada dos seus sementes. De fato, agora sou um pouco fanático por figos.

Risoto de caranguejo, milho doce e chilli (pictured top)

Caranguejo e milho doce estão agora como apostar mr jack bet temporada e este prato relativamente simples combina-os com pimenta chilli e arroz suave. Enrole as mangas e prepare-se para uma boa mistura para libertar os amido natural dos grãos de arroz e desenvolver essa consistência cremosa e confortável que todos amamos. Com risotos, você será informado que a regra de ouro é usar o melhor caldo que puder, mas não há vergonha como apostar mr jack bet usar um dos potes de caldo de peixe: desde que o seu risoto apresente alguns outros ingredientes picantes, ainda estará no caminho certo, além disso, já está obtendo sabor da carne marrom do caranguejo.

Preparar 20 minutos

Cozinhar 30 minutos

Servir 4

150g manteiga

2 cebolas, descascadas e muito finamente picadas

Sal marinho e pimenta preta

2 dentes de alho, descascados e picados

320g arroz carnaroli

125ml vinho branco seco

750ml caldo de peixe ou marisco quente

200g carne marrom de caranguejo, picada ou triturada

1 pequeno milho doce, descascado e os grãos despelados (cerca de 100g; ou use congelado e descongelado)

200g carne branca de caranguejo

1-2 pimentas vermelhas frescas, ao gosto, cortadas finamente (remova e descarte a casca e sementes primeiro, se preferir menos calor)

2 cebolinhas, cortadas e picadas finamente

Suco de 1 pequeno limão

Derreta metade da manteiga como apostar mr jack bet uma panela pesada colocada sobre um fogo médio, então refogue a cebola com uma pitada generosa de sal marinho durante três a quatro minutos, até ficar macia, mas não colada. Adicione o alho e cozinhe, mexendo, por mais um minuto ou dois.

Adicione o arroz à panela e cozinhe, mexendo constantemente, por dois a três minutos, até ficar coberto e lustroso, então despeje o vinho branco na panela para desglacá-la - deve evaporar quase instantaneamente. Adicione uma colher de sopa de caldo quente e cozinhe, mexendo constantemente e pelo menos a cada minuto, sobre um fogo médio-alto, até que o líquido seja absorvido. Repita, adicionando uma colher de sopa de caldo quente de cada vez e mexendo até que seja absorvido, por 10-12 minutos. Não quer que a panela seque, mas também não quer afogar o arroz.

Clique aqui ou escaneie para experimentar esta receita e muitas outras na como apostar mr jack bet versão de teste gratuita da aplicação Feast.

Uma vez que o arroz tenha absorvido a maior parte do caldo, misture a carne marrom de carangueijo e o milho doce, reduza o fogo para baixo e continue cozinhando, misturando regularmente, por mais alguns minutos, até que o arroz esteja macio e dando.

Desligue o fogo e misture a carne branca de carangueijo, os chillis picados e as cebolinhas. Adicione o suco de limão, tempere ao gosto, misture uma última vez, então sirva como apostar mr jack bet tigelas rasas e sirva.

Tarte tatin de figo

A tarte tatin individual de figo do Unruly Pig.

{img}grafia: Louise Hagger/The Guardian. Estilização de alimentos: Emily Kydd. Estilização de cenário: Jennifer Kay. Assistente de estilização de alimentos: Eden Owen-Jones.

Não se assuste com a ideia de fazer massa folhada - apenas cozinheiros profissionais têm tempo para essas coisas - então use apenas folhada pronta do compartimento refrigerado como apostar mr jack bet vez disso, como quase todos os outros fazem. Este é um pudim especial, tão bom para uma festa de jantar quanto é para um confortante lanche da semana média. Serviria-o com nata dupla, mas a creme inglesa feita como apostar mr jack bet casa também seria igualmente deliciosa. Para tartletes individuais, use uma frigideira de ovo pequena (ou uma forma de tartlete). Corte um pequeno círculo de papel manteiga para caber no fundo para impedir que a tarte se pegue, o que é muito provável com toda a caramelos.

Preparar 10 minutos

Cozinhar 30 minutos

Servir 1

2 figos

10g manteiga, macia

20g açúcar mascavo

1 disco de massa folhada, cortado para cerca de 12cm de diâmetro, para caber facilmente sobre o topo de uma frigideira de ovo pequena ou forma de tartlete

Aqueça o forno para 200C (180C fan)/390F/gás 6 e coloque uma bandeja pesada como apostar mr jack bet um prato do meio.

Corte ambos os figos ao meio, então corte cada metade ao meio novamente, para ter oito fatias totais. Generosamente untar a frigideira ou forma de tartlete com manteiga, usando toda a manteiga - sim, pode parecer muito, mas ninguém disse que esta receita é saudável. Cubra a frigideira com todo o açúcar, então dispõe as fatias de figo como apostar mr jack bet volta da frigideira como apostar mr jack bet um padrão de pétala. Coloque o círculo de massa folhada sobre as fatias de figo, então enrole-o firmemente como apostar mr jack bet torno de todos os lados.

Levante a frigideira ou forma na bandeja quente no forno, então assar por 20-25 minutos, até que a massa folhada esteja dourada e cozinhada completamente e o caramelo esteja fervendo como apostar mr jack bet torno dos bordas. Remova, deixe esfriar por cinco minutos, então inverta a tarte como apostar mr jack bet um prato de servir, tomando muito cuidado para não se queimar com o caramelo derretido. Servir enquanto ainda está quente.
